Questions & Answers About anatomy and physiology 252 final exam questions

No	Question	Answer
1	What are the primary functions of the human skeletal system covered in Anatomy and Physiology 252?	The primary functions include support and protection of tissues, facilitation of movement through attachment sites for muscles, mineral storage (such as calcium and phosphorus), blood cell production in the bone marrow, and energy storage in the form of yellow marrow.

2	How does the process of muscle contraction occur at the cellular level?	Muscle contraction occurs when an action potential triggers the release of calcium ions from the sarcoplasmic reticulum, allowing actin and myosin filaments to slide past each other via cross-bridge cycling, ultimately shortening the muscle fiber.
3	What are the main differences between the sympathetic and parasympathetic nervous systems?	The sympathetic nervous system prepares the body for 'fight or flight' responses, increasing heart rate and energy availability, while the parasympathetic nervous system promotes 'rest and digest' activities, conserving energy and reducing heart rate.
4	Which hormones are involved in regulating blood calcium levels, and how do they function?	Parathyroid hormone (PTH) increases blood calcium levels by stimulating bone resorption, increasing intestinal calcium absorption, and reducing calcium excretion by the kidneys. Calcitonin, produced by the thyroid, lowers blood calcium levels by inhibiting bone resorption.
5	What mechanisms are involved in the process of gas exchange in the lungs?	Gas exchange occurs via diffusion across the alveolar-capillary membrane, driven by differences in partial pressures of oxygen and carbon dioxide. Oxygen diffuses from the alveoli into blood, while carbon dioxide diffuses from blood into the alveoli to be exhaled.
